# Interpreting a Data Table

Teacher answer key

## A-C. Answers

A: 1 Automotive (20); 2 Marine (5); 3 50.
B: 1 five / 5; 2 twice; 3 three / 3.
C1: No. Automotive is the most popular; Marine is the least popular.
C2: No. The table gives choices, not reasons. A supported replacement is “Automotive was chosen by 20 students.”

## D-E. Model paragraph

The table shows the workshop visit preferences of 50 students. Automotive has the highest number, while Marine has the lowest. Twenty students chose Automotive, compared with 15 for Electronics. Twice as many students selected Automotive as Interior Design, which has 10 students. Electronics attracted three times as many students as Marine. Overall, the figures show a clear difference between the most and least popular choices.

## F. Acceptable comparisons

Examples: Automotive has four times as many students as Marine. Interior Design has five fewer students than Electronics.
Accept any new comparison supported by the figures. The paragraph is a model, not the only correct response. Check organization and data accuracy before minor language errors.

Lesson connection: Level three new system book, Unit 4; PDF/printed pp. 84, 86-92 and 121-123. Tasks and keys are original classroom practice. Accept equivalent correct responses where appropriate.
